

**TERAKEE VILLAGE
APPROX. 900 S 4500 W
WEST WEBER, UTAH 84404
STORM WATER STUDY**
Project No. 16N719
4-5-2019

General Site Information:

The Terakee Village is located on the north side of 900 South Street and on the east side of 4700 West Street in West Weber, Utah. Construction will consist of a 36-lot residential subdivision, agricultural areas, a small senior assisted living center, common space / park features, roadways, a small parking lot, sidewalks, curb and gutter, and underground utilities when completed.

Storm water from the site will be collected in inlet boxes and catch basins and will continue via storm drain to the south end of the site. Storm water will be detained in one of three detention ponding areas located adjacent to 900 South Street. The site is allowed a unit-release of 0.1 cfs per acre for the 100-yr storm into an existing storm drainage system in 900 South Street and will continue westerly along 900 South in a historical fashion. The attached figure shows the project site and location of the storm water outfalls along 900 South. Detention calculations have been provided for the site. (See attached figure and calculations).

The study area is broken up into 6 drainage areas (labeled A-1 through A-6). A detention facility will be provided to serve A-1 and A-2, another facility to serve A-3 and A-4, and a third facility to serve A-5 and A-6. Improvements in A-3, A-4, A-5, and A-6 will occur at a future date, and the corresponding detention facilities will be required at that time. However, the facility to serve A-1 and A-2 will be installed as part of Phase 1 of this subdivision and will be constructed soon. A runoff coefficient of 0.15 is used for natural ground and landscaped areas. A runoff coefficient of 0.90 is used for asphalt, concrete, buildings, and other hard surfaced areas. An average runoff coefficient of 0.46 was calculated for A-1 and A-2, 0.48 for A-3 and A-4, and 0.27 for A-5 and A-6. This yields a coefficient of 0.39 for the study area as a whole.

Times of concentration are calculated using the FAA method assuming flow resistance coefficients of K=0.35 for landscape and K=0.91 for hardscape for each of the areas. The times of concentration range from about 8 to 24 minutes for the six drainage areas. These times are based on the hydraulically longest drainage path inside each respective drainage area over grass or other vegetation, asphalt, concrete, and/or through a pipeline as applicable. Times calculated to be less than 5 minutes should be rounded to 5 minutes when using this method. Rainfall Intensities were taken from the NOAA website for pipe sizing and detention requirements. The values obtained were interpolated as necessary. A copy of these data is attached.

Data showing area information, runoff coefficient, time of concentration, peak flow, and required detention for the site are also provided and can be found in the attached calculations.

Pipe Sizes:

Storm water pipes in the project are proposed to be polyvinylchloride pipes (PVC), concrete pipe (CP), and/or reinforced concrete pipe (RCP). All pipes in the project are sloped to provide the design capacity while maintaining a minimum scour speed of at least 2 feet per second when the pipes are flowing at least half full. The pipes and inlet boxes have sufficient capacity to convey the 10-year storm without surcharging.

Orifice Plates:

An orifice plate will be used at each facility to control the rate that storm water flows from the project. They will be located at the structures labeled as nodes 33, 58, and 60 (See attached figure). The orifice plate opening at node 33 will have a diameter of 5.26 inches for that detention facility to utilize its capacity during the required 100-yr design storm with an allowable release rate of 0.1 cfs/ac. The orifice plates for the other two facilities will be determined as the designs for those phases are finalized. The orifice plates will allow small flows to pass through without detention. As the rate of storm water into the pipes and detention facilities increases, the orifice plates will restrict the flow. The maximum flow through the plates will occur when the detention basins reach their maximum design depth. A detail of the orifice plates will be provided in the construction documents for the different phases.

Required Detention:

The required detention for the 100-year storm with a release rate of 0.1 cfs/acre is 40,529 cubic feet (cf) for the facility serving A-1 and A-2. The available volume in that detention facility is 40,583 cf. This includes an available 23,271 cf in the ponding area on the east side of Blackbird Lane, 16,258 cf on the west side of Blackbird Lane, and 1,055 cf within the adjacent 30" diameter storm drain pipes. There is a small excess capacity built into this design. Calculations for the other two detention facility requirements are also provided herein. In the event any of the detention facilities experiences a storm larger than the design storm water will then spill out onto 900 South and continue westerly in a historical fashion.

Great Basin Engineering, Inc.

ORIFICE PLATE CALCULATIONS

Q = Total Discharge Rate

$$Q = 0.62 \cdot A_o \cdot \sqrt{64.4 \cdot h}$$

$$A_o = \frac{\pi \cdot d^2}{4}$$

Solving for d , we have.....

$$d = \sqrt{\frac{4 \cdot Q}{0.62 \cdot \pi \cdot \sqrt{64.4 \cdot (TW - FL - d/2)}}$$

Let

$$\Delta = d - \sqrt{\frac{4 \cdot Q}{0.62 \cdot \pi \cdot \sqrt{64.4 \cdot (TW - FL - d/2)}}}$$

Goal-seek Δ to zero by changing "trial d"

Calculations for Pond Serving A-1 and A-2.

TW =	37.50
FL =	34.00
Q =	1.362 cfs
trial d =	0.4387 ft
Δ =	0.000 ft

$$d = 5.26 \text{ inches}$$

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.
