DRAFT

1.0 INTRODUCTION

The Powder Mountain Resort sanitary sewer system is served by Powder Mountain/Sheep Creek Sewage Lagoon supplied by one 10" sewer trunk line. This pipeline extends down the canyon from Powder Mountain Resort in State Road 158 for approximately 4.5 miles. At the intersection of State Road 158 and Snowflake Drive this 10" sewer line heads approximately 1.25 miles west to the sewer outfall and lagoon system. See appendix sanitary sewer exhibits.

The purpose of this feasibility study is to serve as a preliminary informational tool for Powder Mountain to outline wastewater alternatives. This guiding document provides the information necessary in choosing a wastewater option. Master planning based off the chosen wastewater option is the next step.

Every effort was made in the development of this feasibility study is to estimate flows that would approximate sewer district final flows based on land use and development data as outlined in the following Feasibility Study. However, it should be noted that final sewer loading as well as any system upgrades will be determined by Powder Mountain through their approval process. Upgrades required by may or may not coincide with those outlined in the feasibility study due to more accurate information regarding development types and densities as they are proposed.

It should be noted also that this feasibility study is a guiding document that was compiled with the best information available at the time to assist Powder Mountain in wastewater alternatives for master planning the build out resort. As more current information is available and alternatives are chosen, it is strongly recommended that a master plan document be put together.

2.0 MODEL LOADING ESTIMATION AND CALCULATION

Loading was modeled according to Utah Administrative Code R317-3 based on landuse converted to Residential Equivalents (RE). If unit numbers were not available, square footage data was used to estimate the number of RE's per development. Utah Administrative Code R317-3 state that an average peak daily loading of 400 gpd per RE should be used for sizing sewer collection lines. A peaking factor of 2.5 for was used for sewer mains based on the "*Civil Engineering Reference Manual (CERM) 11th Edition*" by Michael Lindeburg.

Loading is based upon the 100 gallons per person per day requirement that John Mackey with the State of Utah's DEQ stated in the *Powder Mountain Water and Sewer Master Plan Review Meeting* with the DEQ dated October 25, 2012. The *United States Census Bureau* states that Utah has an average of 3.04 persons per household in an average residential unit during the 2010 census. Therefore, the Residential Equivalent (RE) has been identified to be 300 gallons per RE. Living spaces apply directly to residential, multifamily and hotels alike, and can be easily modified to a particular development if

the district feels that development will load differently than the average for that development's building type. See Table below for Sewer RE's.

TABLE 1

3.0 ANALYSIS

3.1 EXISTING CONDITIONS

The existing demands on the sanitary sewer system were calculated by using the Utah Automated Geographic Reference Center (AGRC) parcel data to get an understanding of how many existing properties are located in the Powder Mountain Resort as well as contributing to the lagoon system. As shown in Table 2, there are approximately 266 connections. Paul Southwick and Angie Illum with Powder Mountain have indicated based off billing information that there are 179 sewer connections. The difference between the actual connections and parcel connections could be attributed to lots that have not been built on as well as onsite septic systems on older homes.

The existing sewer system at Powder Mountain is a gravity system with no pump stations containing over 40,685 linear feet of pipe and 92 manholes. Main trunk lines and selected peripheral manholes location and elevation data from which to model the existing system was provided by Reeve & Associates, Inc. As there is no manhole invert data available, manholes were assumed to be 9' less than rim elevations or have a minimum slope of 0.5%.

The sewer distribution system extends down State Road 158 and into an existing Slicer House near the top of the existing canyon road just below Powder Mountain's Mid-Mountain area. The intent of the slicer house is to break up the solids into a uniform fluid.

3.2 PHASE 1 SEWER SYSTEM

Phase 1 sanitary loads have been calculated based on the Site Plan provided by Langvardt Design Group. Powder Mountain will connect to the existing system through lateral connections or branching of a line near a manhole. These proposed connections are shown in the Appendix exhibits.

In addition to manholes and pipelines, Phase 1 will require 4 pumps as follows. These Small diameter pressurized discharge pipes are necessary in order to keep velocity of sewerage above 2 ft/s as this is the minimum "cleaning" velocity.

Sewerage Pump Houses

The primary pump station will be located at The Saddle. This PH will accommodate most of the Phase 1 flows. The remaining PHs will accommodate locations adjacent to "*The Nose*". These PHs will pump sewage over Hidden Lake back into the existing gravity system.

3.3 MASTER PLAN SEWER SYSTEM

Master Plan sanitary loads have been calculated based on the High Density Alt. Program outlined in the “*Powder Mountain Planning Studies Summary Book*” conducted by Hart/Howerton in July 18, 2012. Powder Mountain will connect to the existing system through lateral connections or branching of a line by one manhole. These proposed connections are shown in the Appendix exhibits.

In addition to manholes and pipelines, the Master Plan will require 12 additional pumps as shown on exhibits and tables in Appendix.

4.0 MODEL RESULTS

4.1 Existing Condition

In the existing condition, all sewer lines are significantly below pipe capacity with an estimated 140 gpm in the existing condition. Full results can be found in the Appendix.

4.2 Phase 1 Condition

All sewer lines are below pipe capacity with an estimated 223 gpm in the Phase 1 Condition when adding all developments currently shown in the Phase 1 Site Plan. Full results for the existing plus Phase 1 condition can be found in Appendix B.

Conversations with Paul Southwick with Powder Mountain/ Sheep Creek indicated that even though the existing 10” sewer line has capacity to convey the Phase 1 flows, the Lagoon has a maximum of 250 total commitments due to the 100% Containment Program required for this lagoon system. Of these 250 commitments, 179 commitments have been sold. An estimated 71 commitments are left. This would roughly accommodate the larger Phase 1 single family residential lots. Additional coordination with the Utah Department of Water Quality will be necessary to allocate additional connections to the existing lagoon system. Existing flow and volume monitoring at the lagoons indicates that throughout 2011 and through May 2012 the lagoons maintained between 20% and 54% full. However, Mr. Southwick has indicated that up to 10% of that volume can be attributed to infiltration into the conveyance system. PDWSD has indicated that they are in the third year of their plan to mitigate infiltration. This will help reduce the volume of water that unnecessarily enters the existing lagoons. When the existing system maintains 75% full the addition of the previously design lagoon #5 will be initiated. Analysis of the existing flows and number of connections shows that approximately 61-90 additional connections can be added without exceeding that 75% full requirement. Detailed monitoring and analysis of the existing lagoon system should be completed on an on-going basis to maintain compliance with DEQ requirements.

4.3 Master Plan Condition

The existing sewer pipe is above capacity from MH-58 to the Outfall at the Sewer Lagoon with an estimated 609 gpm in the Master Plan Condition when adding all developments currently shown in the “*Powder Mountain Planning Studies Summary Book*”. Full results for the existing plus Phase 1 condition can be found in Appendix B. The existing 10” pipe from MH-58 could handle all Master Plan sanitary loads with the exception of the following Master Plan communities: Stonehouse (Valhalla), Ranch Land Program, DMI & Sundown, Mid-Mountain, Paradise Ridge, Cobabe, Mary's, Rock Outcropping, and the Meadow.

Phase 1 will consume the remaining commitments to the Sewage Lagoons. Options to address Master Plan Communities that need to be discussed are alternative pack bed media systems such as Orenco, septic systems, and a diversion manhole that would direct the remaining portion of the Master Plan sanitary loads to Wolf Creek Water and Sewer Improvement District (WCWSID).

5.0 CONCLUSION AND RECOMMENDATIONS

The Powder Mountain sewer system is adequate to serve the current development, with 4 pump stations; the larger single family residential homes could purchase commitments with the existing lagoon system. Beyond that, even though the 10” system has capacity to the lagoon, the lagoon has exhausted the maximum 250 commitments. The existing sewer system accommodated by an alternative pack bed media system, septic tanks, or a diversion manhole to Wolf Creek Water and Sewer Improvement District (WCWSID) would be the other option to develop the Powder Mountain Resort.

The following recommendations are made to ensure that The Powder Mountain sewer system functions properly and to encourage efficient and timely development of the Powder Mountain Resort.

- As future developments are proposed, the model should be updated and run with proposed densities to determine which, if any, sewer lines will require upgrades to meet capacity requirements. Powder Mountain will have final say as to whether or not lines will need to be upgraded for future development.
- PMWSD should continue monitoring and analysis of lagoon volumes, inflow and outflow rates in an effort to identify actual average flow rates per RE.
- Future development of gravity sewer lines need to maintain 8” or greater and be located in public right-of-ways.
- Close and constant contact with Powder Mountain/ Sheep Creek is strongly recommended throughout the development of Powder Mountain to maintain efficiency.
 1. A formal process of information exchange during pre-design review and design review should be established between the Powder Mountain/ Sheep Creek and the Powder Mountain design review committee.
